Fourth Annual National Moth Week 2015, July 18-26, Celebrates Hawk Moths

Citizen scientists worldwide to observe, document moths

It's a bird, it's a bee ... no, it's a hummingbird moth!

Citizen scientists will be looking for the fascinating hummingbird moth and its relatives in the Sphingidae family this summer as the fourth annual National Moth Week is observed across the U.S. and around the world, July 18 through 26.

Registration is in full swing for this global citizen-science project that celebrates the beauty, diversity and ecological importance of moths. This year, National Moth Week spotlights the Sphingidae family found throughout the world – commonly called hawk moths, sphinx moths and hornworms.

Anyone can participate in National Moth Week. “Moth-ers” of all ages and abilities are encouraged to learn about, observe and document moths in their backyards, parks, and neighborhoods.

Moth-watching and educational events are held throughout Europe, Asia, Africa, South, Central, and North America. This year's public events registered so far include a “[Malt, Hops and Moths](#)” night in Texas, “[Moth and Moon Viewing](#)” in Washington State, “[Moth Mystery Night](#)” in Michigan and moth night at [Grand Canyon National Park](#).

There is no fee to [register](#) a U.S. or international event. Registration is open to individuals, groups and organizations. Participating organizations have included National Parks and Monuments, state and local parks, museums, libraries, camps and nature clubs. Anyone can register a public or private event or find one to attend in their area by checking [nationalmothweek.org](#) for public events.

National Moth Week (NMW) shines a much-needed spotlight on moths and their ecological importance as well as their incredible biodiversity. This nine-day global event encourages children and adults to become “citizen scientists” and contribute photos and data to [online databases](#). Last year, more than 400 events were held in all 50 states and 42 countries.

A moth-ing event can simply involve turning on a porch light at night and watching what happens, or going outside in daylight to find caterpillars and diurnal moths like the hummingbird moth. Participants can use ordinary light bulbs, UV lights, or mercury vapor lights to attract moths, or brush sweet moth bait on tree barks.

Why study moths?

- Moths are among the most diverse and successful organisms on earth.
- Scientists estimate there are 150,000 to more than 500,000 moth species.
- Their colors and patterns are either dazzling or so cryptic that they define camouflage. Shapes and sizes span the gamut from as small as a pinhead to as large as an adult's hand.
- Most moths are nocturnal, but some fly during the day.
- Moths can give us clues about the health of their environment. Decreasing numbers in some locations can indicate problems in the ecosystem.

The Sphingidae family includes many widely found species, besides the day-flying hummingbird moth, (genus *Hemaris*) a “hawk moth” also known as clearwings, which mimics hummingbirds and bumblebees. Also among the estimated 1,450 Sphingidae species are the Pandorus sphinx, Elephant hawk moth, White-lined sphinx, Gaudy sphinx and One-eyed sphinx. It is believed they get their nickname of “hawk moth” from their rapid flight.

“Hawk moths are important pollinators of native plants, especially in arid environments like the American Southwest,” said NMW team member Dr. Elena Tartaglia. “They visit plants to get nectar and in the process, their large furry bodies can carry a lot of pollen. Like most moths, they are an important component of food webs as food for birds, small mammals, lizards and predatory insects.”

Through partnerships with major online biological data depositories such as [BAMONA](#), [Project Noah](#), [Encyclopedia of Life](#), [Discover Life](#), and [iNaturalist](#), National Moth Week encourages participants to record moth distribution and to provide information on other aspects of their life cycles and habitats.

National Moth Week is a project of the Friends of the East Brunswick (NJ) Environmental Commission, a nonprofit organization dedicated to environmental education and conservation. The event grew out of local summer “Moth Nights” organized by David Moskowitz and Liti Haramaty of the Friends since 2005.

In March, a [bill to name the lo moth the official state moth](#) was introduced by N.J. Assemblywoman Nancy Pinkin in the New Jersey State Legislature. If passed and signed by the governor, New Jersey would become the first state to designate a state moth.

“National Moth Week raises awareness about the amazing world of nighttime nature that many people have never observed,” said Moskowitz, an environmental consultant and Ph.D. candidate in entomology at Rutgers University. “Thousands of photos taken by citizen scientists at mothing events have been uploaded to data depositories by participants.”

"Moths can be observed anywhere, anytime," said NMW co-founder Liti Haramaty. "It's easy and fun – just turn on a light and wait for the moths to find it. Anyone with a cell phone or digital camera can contribute to our knowledge about moths' diversity and distribution, and help us to better understand the impact of human activities on the ecology of our planet."

“National Moth Week is a fun and educational way to introduce kids to science through the world of moths,” said Jacob Gorneau, 17, a junior at Greenville (N.Y.) High School and the youngest member of the NMW team. “With about 12,000 species in North America, and many more to be described, the beginner can expect something new at the light almost every time,”.
